

Analysis report examination with Cube

Markus Geimer Jülich Supercomputing Centre

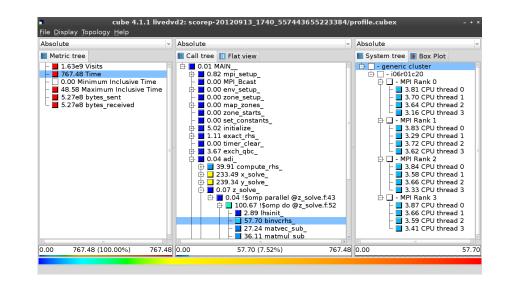

Local setup

 On Mistral, the Cube GUI and tools are provided as part of the Score-P and/or Scalasca modules

```
% module load scorep/3.0-bullxmpi_mlx-intel16
% module load scalasca/2.3.1-bullxmpi_mlx-intel16
% which cube
/sw/rhel6-x64/analysis-tools/cube-4.3.4-gccsys/bin/cube
```

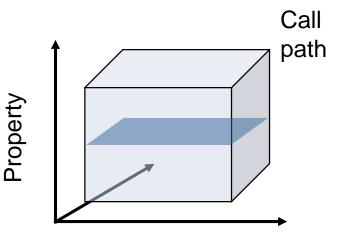

Cube

- Parallel program analysis report exploration tools
 - Libraries for XML+binary report reading & writing
 - Algebra utilities for report processing
 - GUI for interactive analysis exploration
 - Requires Qt4 \geq 4.6 or Qt 5
- Originally developed as part of the Scalasca toolset
- Now available as a separate component
 - Can be installed independently of Score-P, e.g., on laptop or desktop
 - Latest release: Cube 4.3.4 (April 2016)

Analysis presentation and exploration

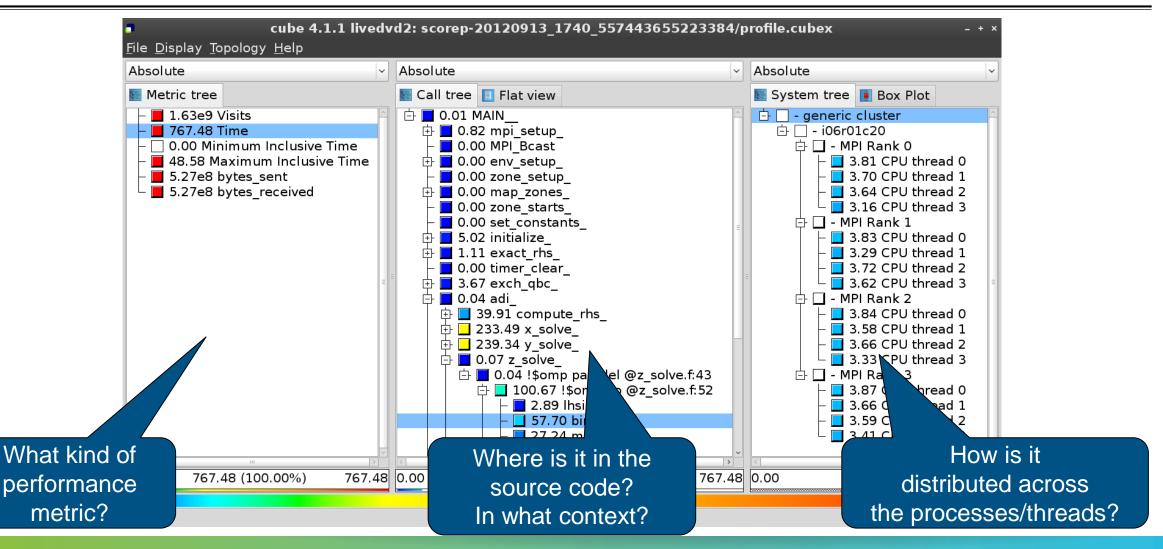

- Representation of values (severity matrix) on three hierarchical axes
 - Performance property (metric)
 - Call path (program location)
 - System location (process/thread)
- Three coupled tree browsers
- Cube displays severities
 - As value: for precise comparison
 - As color: for easy identification of hotspots
 - Inclusive value when closed & exclusive value when expanded
 - Customizable via display modes

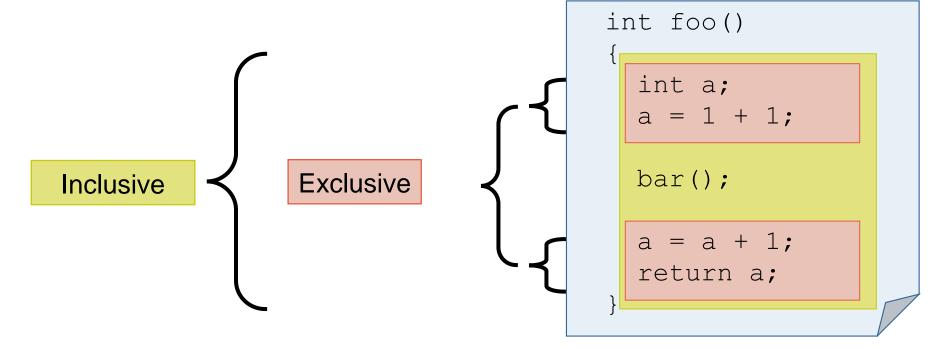

VIRTUAL INSTITUTE - HIGH PRODUCTIVITY SUPERCOMPUTING

Analysis presentation

Inclusive vs. exclusive values

- Inclusive
 - Information of all sub-elements aggregated into single value
- Exclusive
 - Information cannot be subdivided further

Alternative display modes

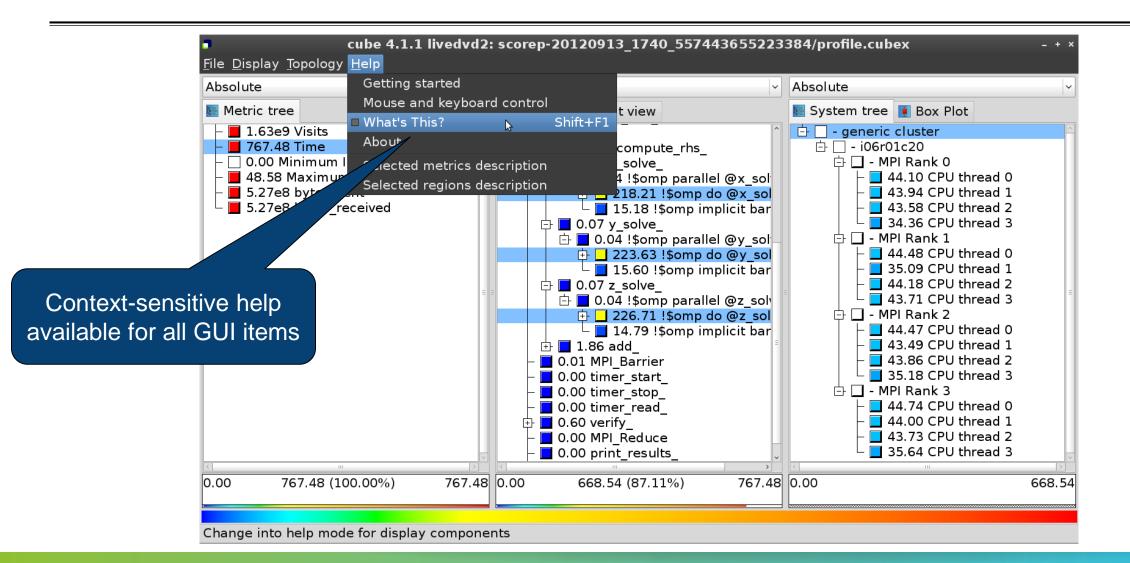

Important display modes

- Absolute
 - Absolute value shown in seconds/bytes/counts
- Selection percent
 - Value shown as percentage w.r.t. the selected node "on the left" (metric/call path)
- Peer percent (system tree only)
 - Value shown as percentage relative to the maximum peer value

Multiple selection

Context-sensitive help

Derived metrics

Derived metrics are defined using CubePL expressions, e.g.:

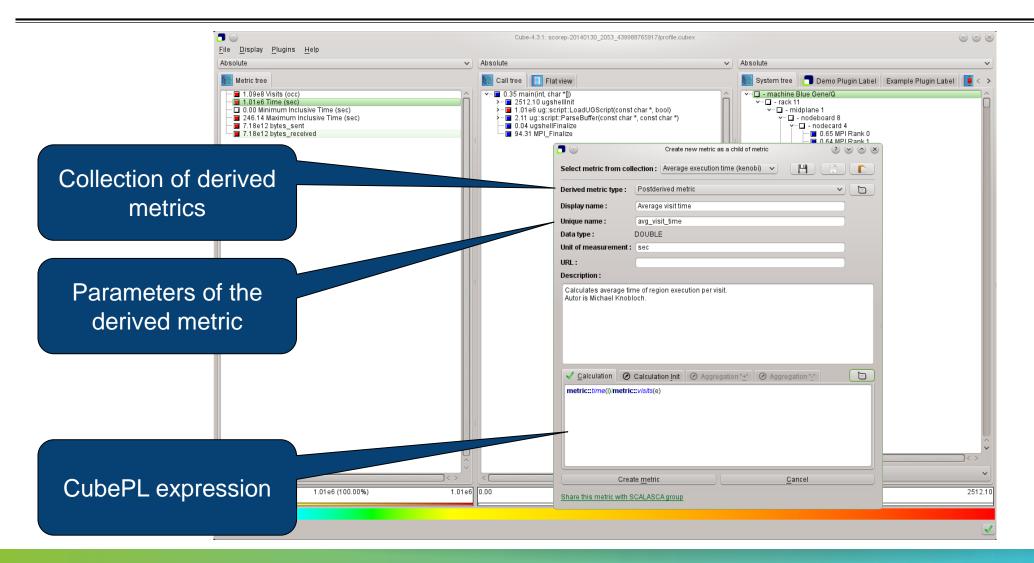

metric::time(i)/metric::visits(e)

- Values of derived metrics are not stored, but calculated on-the-fly
- Types of derived metrics:
 - Prederived: evaluation of the CubePL expression is performed before aggregation
 - Postderived: evaluation of the CubePL expression is performed after aggregation
- Examples:
 - "Average execution time": Postderived metric with expression

metric::time(i)/metric::visits(e)

 "Number of FLOP per second": Postderived metric with expression metric::FLOP()/metric::time()

Derived metrics in Cube GUI

Example: FLOPS based on PAPI_FP_OPS and time

CUBE algebra utilities

Extracting solver sub-tree from analysis report

% cube_cut -r '<<ITERATION>>' scorep_bt-mz_B_mic15p30x4_sum/profile.cubex Writing cut.cubex... done.

Calculating difference of two reports

% cube_diff scorep_bt-mz_B_mic15p30x4_sum/profile.cubex cut.cubex
Writing diff.cubex... done.

- Additional utilities for merging, calculating mean, etc.
- Default output of cube_utility is a new report utility.cubex
- Further utilities for report scoring & statistics
- Run utility with `-h' (or no arguments) for brief usage info

Iteration profiling

- Show time dependent behavior by "unrolling" iterations
- Preparations:
 - Mark loop body by using Score-P instrumentation API in your source code

```
SCOREP_USER_REGION_DEFINE( scorep_bt_loop )
SCOREP_USER_REGION_BEGIN( scorep_bt_loop, "<<bt_iter>>", SCOREP_USER_REGION_END( scorep_bt_loop )
```

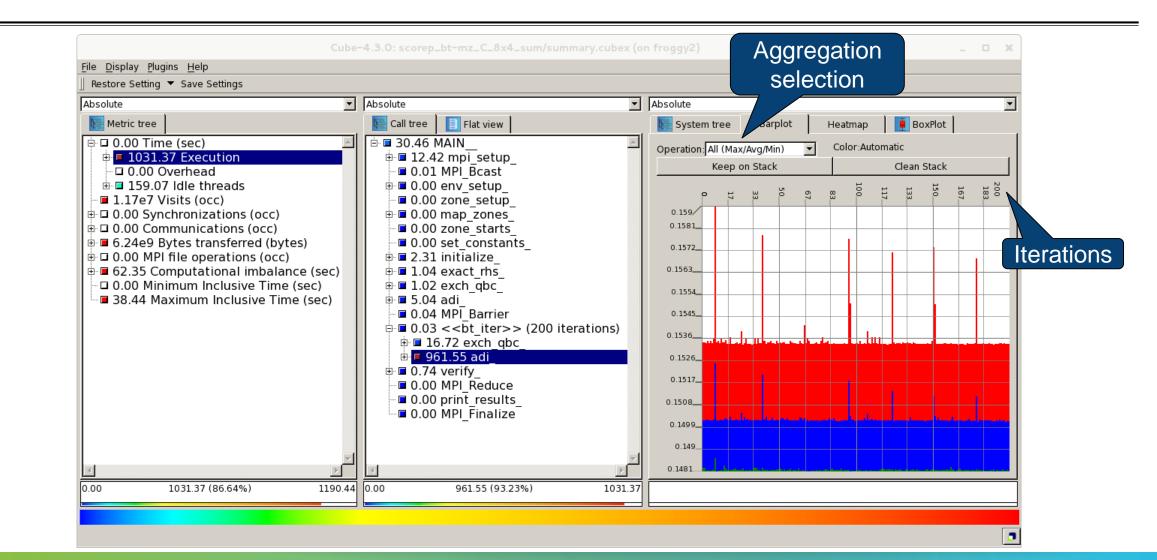

- Result in the Cube profile:
 - Iterations shown as separate call trees
 - Useful for checking results for specific iterations

or

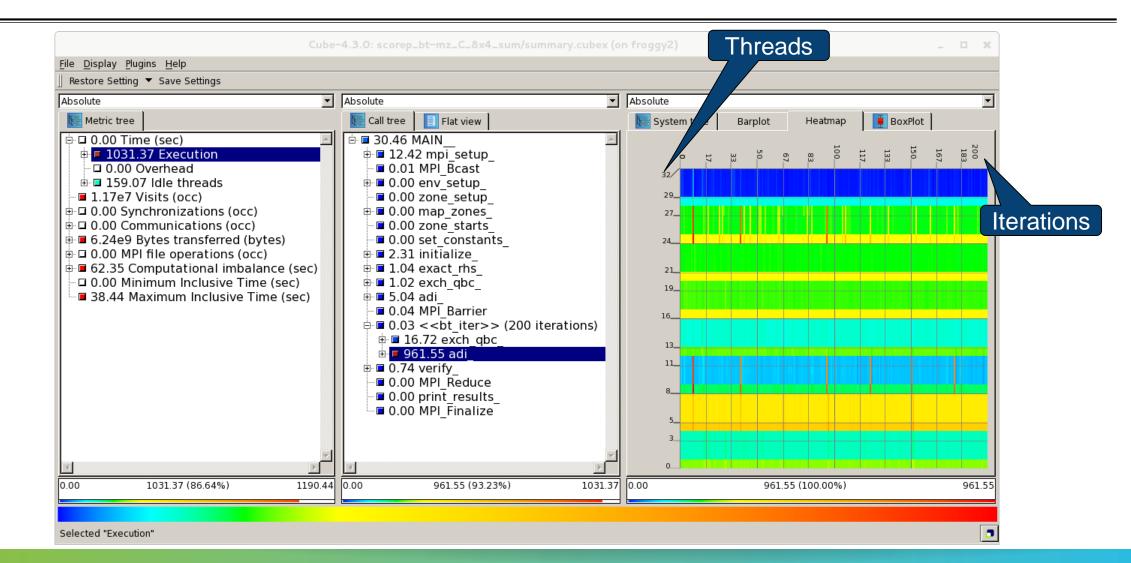

- Select your user-instrumented region and mark it as loop
- Choose "Hide iterations"
- > View the Barplot statistics or the (thread x iterations) Heatmap

VICTOR COMPUTING

Iteration profiling: Barplot

Iteration profiling: Heatmap
